15 Thermal energy ΔE is supplied to an object of mass m which does not change its state during the heating process. The temperature of the object rises by ΔT.

What is the specific heat capacity of the object?

A $\frac{\Delta E}{m\Delta T}$ **B** $\frac{m\Delta T}{\Delta E}$ **C** $\frac{\Delta E\Delta T}{m}$ **D** $\frac{\Delta Em}{\Delta T}$
