9 A boy uses a rope to pull an object of mass m up a slope.

The rope is parallel to the slope.

The tension in the rope is constant and of value F.

The object moves a distance d along the slope and rises through a height h.

How much work is done by the boy?

A $F \times d$

B $F \times h$

C $m \times g \times h \times d$

D $m \times g \times h^2$
