13 Air in a sealed syringe is slowly compressed by moving the piston. The temperature of the air stays the same.

Which statement about the air is correct?

A The pressure of the air decreases because its particles now travel more slowly.

B The pressure of the air decreases because the area of the syringe walls is now smaller.

C The pressure of the air increases because its particles now hit the syringe walls more frequently.

D The pressure of the air increases because its particles now travel more quickly.
