15 Iron is a better conductor of thermal energy than rubber.

Which statement explains this?

A Electrons in iron can move from one part of the iron to another. Electrons in rubber **cannot** move in this way.

B Electrons in iron vibrate with more energy than those in rubber.

C Positive particles in iron can move from one part of the iron to another. Positive particles in rubber **cannot** move in this way.

D Positive particles in iron vibrate with more energy than those in rubber.
