28 A beam of light with power P has an area of cross-section A.

The amplitude of the light waves in the beam is X.

The beam of light is then changed to one with the same frequency but with an increased amplitude of $4X$ and an area of cross-section reduced to $\frac{A}{3}$.

What is the power of the new beam?

A $1.3P$ **B** $5.3P$ **C** $12P$ **D** $48P$
